Speeding up the web

Faster page loads using server think-time with Early Hints

Find out how your server can send hints to the browser

Optimizing resource loading with Priority Hints

Priority hints indicate the relative priority of resources to the browser. They can enable optimal loading and improve Core Web Vitals.

A new speed milestone for Chrome

Monday, March 7, 2022

"Chrome continues to get faster on Android as well. Loading a page now takes 15% less time, thanks to prioritizing critical navigation moments on the browser user interface thread."

bit.ly/chrome-android-perf-2022

Scaled Activation

A diagram illustrating a scaled activation function. It features a central light blue rectangle with a dashed black border. The text "Scaled Activation" is centered within this rectangle in a large, bold, black font. At each of the four corners of the rectangle, there is a small white circle with a black outline. From each circle, a black arrow points outwards, away from the rectangle, towards the corners of the slide.

Measuring the web

Percent of websites having good Core Web Vitals

Percent of websites having good Core Web Vitals

Where are the opportunities?

**36% of websites are
built with WordPress**
